Nodevember 4.0

Akatsuki's Draft: AI-Enabled Content Sharing Platform

(Backend)

Akatsuki's Draft is a platform where users can create, edit, and publish content. Users can register and log in securely, create posts or save them as drafts, and manage their content. AI-powered improvement helps users enhance their writing while preserving the original draft as a separate version. Posts are submitted for admin approval before becoming publicly accessible. Admins can review pending posts and approve or reject them. The backend uses JWT authentication to secure access and MongoDB to store user details and content, providing a structured system for content creation, improvement, and publishing.

Schema Design 1.

1. **User Schema** :

   {name, email , password, role}

   roles: "admin" || "user"

2. **Post Schema :**

   { title, description, content, image, category, createdBy (ref. User), status, createdAt }

   status: "draft" | "pending" | "approved" | "rejected"

APIs and their purpose

Authentication

- POST /auth/register — Register a new user.
- POST /auth/login — Log in and receive a JWT token.
- GET /auth/me — Get the currently logged-in user's details after login.

User — Post Management

- POST /posts — Create a new post or draft.
- GET /posts — View all approved posts.
- GET /posts/:id — View an approved post by ID.
- GET /posts/my-posts — View your own posts and drafts.
- PATCH /posts/:id — Update your own post.
- DELETE /posts/:id — Delete your own post.

Admin — Post Approval

- GET /admin/posts/pending — View posts awaiting approval.
- PATCH /admin/posts/approve/:id — Approve a post.
- PATCH /admin/posts/reject/:id — Reject a post.

AI Integration — Content Improvement

- POST /ai/improve/:postId — Improve the content using AI and save it as a new draft with a new ID under the same user, preserving the original draft.
